

INSTALLATION MANUAL

for following Blasterparts modification-kits:

NERF N-Strike Elite **Alpha Trooper CS-12**

NERF N-Strike Elite **Rampage**

NERF N-Strike Elite **Retaliator**

Equivalent mass of spring: 7kg*/8kg**

Approx. range : 25-30m*/30-35m**

*Tactical Range / **Hard Range

Thank you for purchasing a Blasterparts mod kit.

Here is a short manual to guide you through the most important steps for the installation of the kit into your blaster.

Removing air-restrictor in combination with this kit is not recommended!

1. Open the blaster by losing all screws of the housing. In mechanical blasters there are often screws hidden under the sled. To remove these you have the slide it to another position.

Note: Make sure to remove screws with a matching screwdriver. If the screw are worn out it gets pretty difficult to remove them.

2. Once the blaster is open take out the cylinder (plunger), bolt-sled and catch.

3. Now the stock-spring and the catch-spring have to be replaced with the provided springs.

Notes: The modification-spring may have a different geometry compared to the stock-spring. E.g. it may be longer or has a different diameter. This is intentional. All our mod-springs are designed for fit into the blasters they are meant for and have been tested.

With the kits for Rampage and AlphaTrooper also the strap that connects the boltsled to the foregrip and the catch need to be replaced by the parts provided with the mod-kit.

4. After all parts are returned to their original positions the blaster can be closed again. When there is a sled make sure it is in the correct position.

5. Before you put all of the screws into the case again just put in a view screws and check functionality of the Blaster. 3-4 screws should be sufficient for that issue.

Note: Don't turn in the screws too tightly. Maybe you won't be able to remove the screws a second time

6. Finally the guiding-shell needs to be put with the flat side forward into the holder for the buttstock. Then this holder can also be screwed to the blaster.

Note: The guiding-shell prevents the piston from twisting and helps to avoid unwanted triggering of the blaster.

Any Questions?

Visit the FAQ on our website www.blasterparts.de or do not hesitate to contact us via Email: info@blasterparts.de.

If there occur any problems during installation you can also contact us over our support-area at www.blasted.de

We wish you a pleasant Modding Session!

Additional Information

The modification springs offered by Blasterparts are neither official products of nor affiliated with the original manufacturer / distributor of the named blaster. Modifying your dartblaster in any way happens at your own risk. We would like to point out that the offered dartblasters are explicitly not intended for modifications (e.g. installing a stronger spring) by the manufacturer. Installing one of our modification brings a considerable boost in performance. If you use a modified dartblaster while playing with other persons, for example in a "nerf war" or a Live Action Role Playing game, you have to wear a pair of safety goggles. Never aim at the eyes or face of another person. In addition to installing our modification spring the so called "air restrictor" can be removed. Due to safety reasons we explicitly advise that you do not modify the blaster any further technically. Local weapon laws may apply after modifying your blaster in technical or even certain optical ways.
